

## LightBend ${ }^{\text {TM }} 1 \times 2$ PM OptoMechanical Fiberoptic Switch <br> (Bidirectional)

(Protected by U.S. patent 6823102 and pending patents)

## Product Description

The LB series $1 \times 2$ PM fiber optic switch is a polarization-maintaining fiber switch, which connects optical channels by directing or blocking an incoming optical signal into the output fiber. This is achieved using a patent pending opto-machnical configuration and achieved via an electrical control signal. A latching version preserves the selected optical path after the drive signal has been removed, while the nonlatching version defaults to either the open or close state when power is removed. The switches integrated electrical position sensors. The new material-based advanced design significantly reduces moving part position sensitivity, offering unprecedented high stability as well as an unmatched low cost. Electronic driver is available for this series of switches. The switch is bidirectional.

## Applications

- Fault Protection
- Channel Add/Drop
- Channel Switching
- Instrumentation

## Electrical Driving Requirements

The load is a resistive coil which is activated by applying 5 V (draw $\sim 40 \mathrm{~mA}$ ). Applying too long pulse for the latching version will heat up the device. Agiltron offers a computer control kit with TTL and USB interfaces and Windows ${ }^{\top M}$ GUI. We also offer RS232 interface as an option - please contact Agiltron sales.
